RAS-Backend Database Connectivity & Schema Audit Report
Date: 2026-10-22
Scope: Branches created/updated in last 24 hours

Branches Reviewed:
1) feature/backend-menu-api
2) feature/backend-central-kitchen-supply
3) feature/backend-inventory-api
4) feature/backend-transfer-api
5) feature/backend-sales-api
6) feature/backend-cost-api

1) Database Connectivity:
- Standard DB is shared PostgreSQL restaurant_db.
- New branches connect using DATABASE_URL.
- They connect to whatever DATABASE_URL points to (not branch-pinned DB by code).

2) Tables/attributes in main DB:
- Main has: branches, users, refresh_tokens, employees, attendance_records, deductions, overtime.
- Missing in main central migrations: categories, menu_items, menu_item_requests, menu_item_costs, recipe_components, shifts, sales, sale_items, discounts, inventories, inventory_movements, goods, supply_requests, supply_request_items, transfers, transfer_events.

3) Required fix:
- Add all new schema through central Goose migrations in /database/migrations.
- Stop using service-local migration histories as source of truth.
- Remove runtime migration execution from API startup.
- Add service role grants, env examples, compose/CI integration for new services.

4) Current mistakes:
- No central migration files added for these six branches.
- Transfer depends on tables/columns not provisioned centrally.
- Inventory branch runs migrations at startup (architecture mismatch).
- Menu branch has import/compile issues in current snapshot.
- Naming/module inconsistencies in central-kitchen-supply.

5) Extra required edits:
- Add migration dependency order and schema-compat CI checks.
- Align module/import/startup patterns with existing services.

Conclusion:
The six branches are not yet fully integrated with the main shared DB workflow.
They need central migrations + config/CI alignment before safe merge.
